

Connector Health Audit: QuickBooks Online & Xero

Stockroom Cloud (FICTIONAL SAMPLE) · 30 days of API logs · 1,215,598 calls · Prepared by: Tapish Khandelwal

Sample built on a synthetic log. The vendor and every figure are invented; tier prices are the published ones as of September 2026.

Result. Two changes move the app from Intuit Silver to Builder and from Xero Advanced (A\$1,445/mo) to Plus (A\$245/mo): about **\$300/mo plus A\$1,200/mo** in platform fees. The bigger issue is reliability: 804 duplicate invoices in customers' books this month. The Xero scope migration has a hard deadline of 13 Sep 2027.

Findings

Priority	Finding and evidence	Fix	Effect
High	Journals endpoint keeps the app on Xero Advanced The nightly Journals pull (2.31 GB a month) is the only reason the app needs <code>accounting.journals.read</code> , which Xero grants only from the Advanced tier up, after a security assessment. The other traffic (140 connections, 1.84 GB after fixes) fits Plus.	Rebuild the ledger view from incremental Invoices, BankTransactions and ManualJournals reads.	A\$1,445/mo → A\$245/mo
High	15-minute polling burns QuickBooks CorePlus credits 777,600 metered reads in 30 days; 729,042 returned data that had not changed. 129,600 were hourly Profit & Loss pulls for one dashboard widget.	Webhooks (CloudEvents format) plus <code>ChangeDataCapture</code> for deltas, one daily sweep, cached reports.	Intuit Silver (\$300/mo) → Builder (\$0); 58,968 reads
High	Retries create duplicate invoices in customers' books 804 orders were posted twice across 192 customer files, mostly after a 500 response followed by an immediate retry with no idempotency check.	Check for an existing document by the order reference before retrying; back-off with jitter.	Fewer support tickets and bookkeeper complaints
Medium	Token refresh failures leave connections silently broken 162 unauthorised (401) responses across 101 QuickBooks connections; the app keeps polling instead of flagging the connection for the customer to reconnect.	Refresh-token rotation audit; mark the connection broken and email the customer on first 401.	Sync stops failing unseen
Medium	Rate limiting on Xero invoice posts 582 rate-limited (429) responses on invoice creation; retries ignore the Retry-After header.	Honour Retry-After; queue per organisation; batch up to Xero's per-call limits.	No lost invoices
Deadline	Xero granular scopes: every connection must re-consent by 13 Sep 2027 Apps created before 2 March 2026 can request granular scopes from April 2026 and must migrate by 13 Sep 2027. Existing tokens are not upgraded: each customer has to re-authorise. Broad scopes are replaced by narrower ones: for example, <code>accounting.transactions</code> by <code>accounting.invoices</code> .	Map every call to its granular scope, ship the new consent URL, migrate on reconnect, then chase stragglers.	No forced disconnections in September 2027

How this was measured

From the vendor's own request log (or API-gateway export): method, endpoint, status, response bytes, tenant, external id, retry flag. Metered QuickBooks reads are counted as successful data-out calls (Intuit App Partner Program "CorePlus"); Xero egress is the size of successful GET responses. Tier caps and prices: developer.intuit.com App Partner Program guide; [developer.xero.com/pricing](https://developer.xero.com) and the developer changelog.

Engagement

This measurement is the first step of a fixed-price sprint, paid half up front. **Upkeep** after a delivered project: US\$600 a month covering API changes and deprecations, sync failures and customer-escalated sync bugs, with a 2-business-day response. Work happens in the vendor's repository and sandbox companies; no production ledger access.
